

1. In which of the following conditions, the distance between the molecules of hydrogen gas would increase?

(c) (ii) and (iii) Some hydrogen gas leaking out reduces the number of particles in the container, increasing the volume allows the gas molecules to spread out farther apart.

2. A form of matter has no fixed shape but it has a fixed volume. An example of this form of matter is:

- Kerosene

Kerosene is a liquid, which has a fixed volume irrespective of the shape of its container, but it takes the shape of the container it is put in.

3. Which one of the following statements is not true?

(b) The molecules in a liquid are arranged in a regular pattern.

Unlike solids, liquids do not have a regular pattern of arrangement; the molecules are randomly arranged and have some freedom to move.
